This paper proposes a sliding mode observer (SMO) with adaptive gain variation for the permanent synchronous motor magnet (PMSM) for estimating motor speed and position. The observer is designed to make the drive sensorless, speed estimation and rotor position using back-electromotive force (Back-EMF).

An adaptive terminal-integral sliding mode force control is proposed by considering the hysteresis and the effects between the end effector and a flexible environment. Force control has not been studied extensively nowadays and even less for elastic joint robot manipulators. Thus, to improve the system precision control, the adaptive sliding mode controller (ASMC) is designed by a Lyapunov approach obtaining the adaptive and controller laws, respectively.
