Electromechanical transients happen when the electrical power produced by a generator is no longer equal to the mechanical power that drives the generator itself (this power coming from a turbine powered by water or steam), causing the generator to either speed up or slow down compared to its normal rotation speed.

What is transient in electrical power systems? - Quora

Electrical transients are momentary bursts of energy induced upon power, data, or communication lines. They are characterized by extremely high voltages that drive tremendous amounts of current into an electrical circuit for a few millionths, up to a few thousandths, of a second.

Transients are power quality disturbances that involve destructive high magnitudes of current and voltage or even both. It may reach thousands of volts and amps even in low voltage systems. However, such phenomena only exist in a very short duration from less than 50 nanoseconds to as long as 50 milliseconds.

Electrical Transients in Power Systems - Greenwood, Allan ...

A transient can be a unidirectional impulse of either polarity or a damped oscillatory wave with first peak occurring in either polarity. The term transients has been used in the analysis of power system variations to denote an event that is undesirable and momentary in nature.

Transients and Its Classification | Power System | Electricity

A transient event is a short-lived burst of energy in a system caused by a sudden change of state. The source of the transient energy may be an internal event or a nearby event. The energy then couples to other parts of the system, typically appearing as a short burst of oscillation.

Transient (oscillation) - Wikipedia

This book deals with electrical transients in the power system. Much has been learned about transient phenomena since the early days of power system operation. Pioneers in this field were men like Charles Proteus Steinmetz and Oliver Heaviside who focussed on the understanding of electrical transientsin a more or less general way.

One of the causes of the creation of such transients is that of Lightning. Their mode of action is usually indirect and exerts it through affecting the power line. They generate induced transients by coupling into the power system. Another cause is that of the routine utility tasks which include:
