Respiratory Physiology is just what it promises an in depth look at the workings of the respiratory system broken down into manageable units. This book does a phenomenal job of explaining the key concepts simply without sacrificing detail.

Respiratory Physiology: The Essentials (Respiratory ...

The main function of the respiratory system is gas exchange (O₂ and CO₂). Ventilation is the movement of air through the respiratory tract into (inspiration) and out of (expiration) the respiratory zone. The physiologic dead space is the volume of inspired air that does not participate in gas exchange.

Respiratory physiology is a subcategory of human physiology that studies the respiratory system of the human body as well as breathing patterns, oxygen distribution and control within the body. The respiratory system. The main area of study within respiratory physiology is respiration.

What is Respiratory Physiology? (with pictures)

In respiratory physiology compliance is defined as the change in volume produced by a change in pressure across the wall of the structure being investigated: the lungs alone, the lungs and chest wall, or the chest wall alone (which is very rarely measured). Compliance = Change in volume / Change in pressure

Respiratory function is fundamental in the practice of anesthesia. Knowledge of basic physiologic principles of respiration assists in the proper implementation of daily actions of induction and maintenance of general anesthesia, delivery of mechanical ventilation, discontinuation of mechanical and pharmacologic support, and return to the preoperative state.

The respiratory system consists of structures involved in moving air into and out of the lungs (bulk flow) and in gas exchange (diffusion). LUNGS AND CHEST WALL act as a unit. Each lung is surrounded by a membranous sac (pleura) filled with a thin film
