Assuming a familiarity with the basic features of modern probability theory, the text develops the foundations of the general theory of stochastic processes, examines processes with a continuous-time parameter, and applies the general theory to procedures key to the study of stationary processes. Additional topics include analytic properties of the sample functions and the problem of time distribution of the intersections between a.

For example, the pulsations of the force of a current or the voltage in an electrical chain (electrical "noise") can be considered as stationary stochastic processes if the chain is in a stationary system; the pulsations of velocity or pressure at a point of a turbulent flow are stationary stochastic processes if the flow is stationary, etc.

Stationary stochastic process - Encyclopedia of Mathematics

Strictly stationary stochastic processes have underlying probability distributions that do not change in time, so their mean, variance, and autocorrelation are constant. (The authors also consider wide-sense or covariance-stationary processes.) A sample function is a realization of a random process.

Synopsis This graduate-level text provides an account of the general theory of stationary processes, with special emphasis on the properties for sample functions. The book develops the foundations of the general theory of stochastic processes, looking particularly at processes with a continuous-time parameter.

Stationary and Related Stochastic Processes: Sample ...

In mathematics and statistics, a stationary process (or a strict/strictly stationary process or strong/strongly stationary process) is a stochastic process whose unconditional joint probability distribution does not change when shifted in time. Consequently, parameters such as mean and variance also do not change over time.

Stationary process - Wikipedia

Examples of non-stationary processes are random walk with or without a drift (a slow steady change) and deterministic trends (trends that are constant, positive, or negative, independent of time ...

A (Gaussian) noise is a special stationary stochastic process $\eta(t, \omega)$, with mean $E\eta_t = 0$ and covariance $E(\eta_t \eta_s) = Kc(t - s)$ for all t and s , for constant $K > 0$ and a function $c(\cdot)$. When $c(t - s)$ is the Dirac delta function $\delta(t - s)$, the noise η_t is called white noise; otherwise it is called colored noise.

Stationary and Related Stochastic Processes (□□)

A stochastic process is trend stationary if an underlying trend (function solely of time) can be removed, leaving a stationary process. Meaning, the process can be expressed as $y_i = f(i) + \varepsilon_i$, where $f(i)$ is any function $f: \mathbb{R} \rightarrow \mathbb{R}$ and ε_i is a stationary stochastic process with a mean of zero.

Stationarity in time series analysis | by Shay Palachy ...

A stochastic process is truly stationary if not only are mean, variance and autocovariances constant, but all the properties (i.e. moments) of its distribution are time invariant. Example 1 : Determine whether the Dow Jones closing averages for the month of October 2015, as shown in columns A and B of Figure 1 is a stationary time series.
